Academic Year: 2025-26 **Semester: V Class /**
Branch: TE IT
Subject: DevOPs Lab (DL)
Subject Lab In-charge: Prof. Sujata Oak

EXPERIMENT NO.12

Aim: Deploy a website code on the node by provisioning mysql server and database using ansible playbook.

Theory: MySQL Database is a client/server system that consists of a multithreaded SQL server that supports different back ends, several different client programs and libraries, administrative tools, and a wide range of application-programming interfaces (APIs).

Primary Terminologies

- **MySQL:** For the storage and management of structured data, a lot of people use MySQL, an open-source relational database management system (RDBMS). It offers components, for instance, SQL support, data security, versatility, and execution.
- **Ansible** is a configuration management tool. it is a suit of software tools that enables infrastructure as code.it is an open source and suit includes software provisioning, configuration management and application deployment functionality. There is no need to install run time, as it is a stand-alone tool.
- **Ansible Playbooks-** playbooks are the basis for really a simple configuration management and multi-machine deployment system. Ansible playbooks are YAML documents containing a set of instructions for Ansible to execute on remote hosts. Playbooks automate tasks like software installation, service configuration, and file management by defining the desired state of systems.
- **Modules for Ansible-** Ansible modules are little projects that perform tasks on remote hosts. For common tasks like package management, file manipulation, and service control, Ansible has a lot of built-in modules. The Ansible engine runs modules on the target hosts and sends back the results to the control node.

STEP1:

Ansible-master:

root@ip-172-31-18-177:~/ansible-lab/ansible-codes# nano mysqlmodule.yml

```
root@ip-172-31-18-177:~/ansible-lab/ansible-codes# nano mysqlmodule.yml
```

```
 GNU nano 7.2                          mysqlmodule.yml
- hosts: client_1
  remote_user: root
  tasks:
    - name: 2. Start Mysql Service
      service: name=mysql state=started enabled=true

    - name: Install python package #required for mysql_db tasks
      apt: name=python3-pip state=present

    - name: Install Mysql-python package #required for mysql_db tasks
      apt: name=python3-mysqldb state=present

    - name: 3. Create a new database
      mysql_db: name=demo state=present collation=utf8_general_ci

    - name: 4. Create a database user
      mysql_user: name=sujata password=123456 priv=*.*:ALL host=localhost state=present

    - name: 5a. Copy sample data
      copy: src=users.sql dest=/tmp/dump.sql

    - name: 5b. Insert sample data
      shell: cat /tmp/dump.sql | mysql -u sujata -p123456 demo

^G Help        ^O Write Out   ^W Where Is    ^K Cut         ^T Execute     ^C Location
^X Exit        ^R Read File   ^\ Replace     ^U Paste       ^J Justify     ^/ Go To Line
```

root@ip-172-31-18-177:~/ansible-lab/ansible-codes# cat users.sql

```
root@ip-172-31-18-177:~/ansible-lab/ansible-codes# cat users.sql
-- phpMyAdmin SQL Dump
-- version 4.1.14
-- http://www.phpmyadmin.net
--

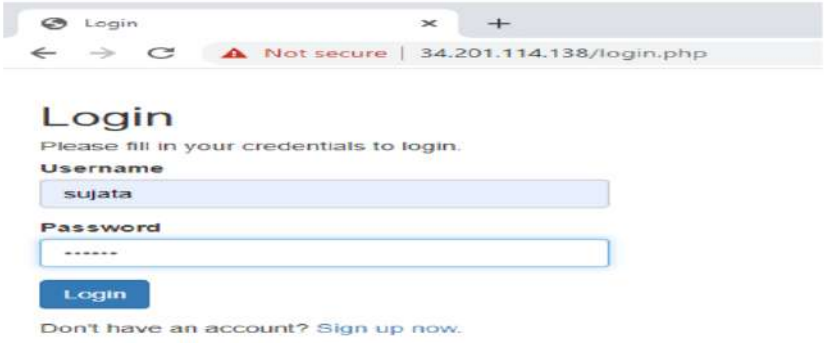
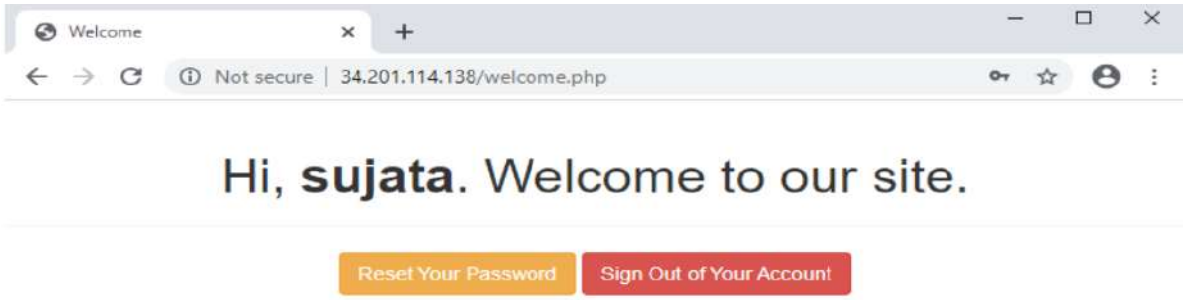
config.php  login.php  register.php  welcome.php
index.html  logout.php  reset-passowrd.php
```

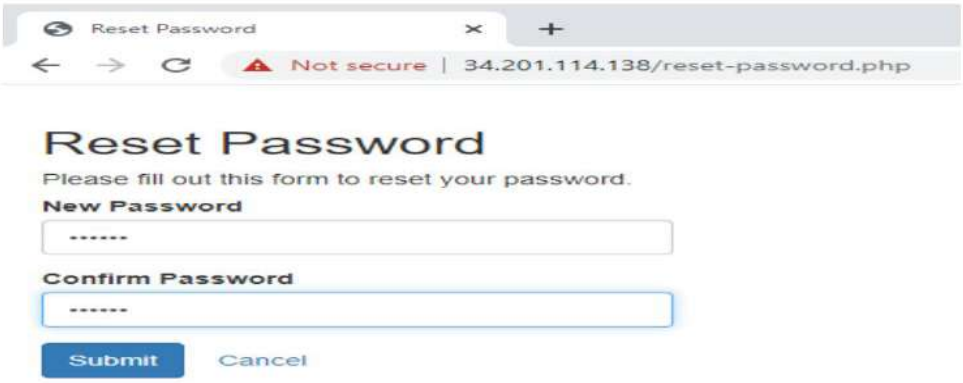
STEP5: Goto Browser: ansible-slave machine IP address/login.php



IP address/welcome.php



IP address/reset-password.php



Conclusion: In the experiment, we successfully deploy a website code on the node by provisioning mysql server and database using ansible playbook.
